

## Industry Workshop

### Workshop Title

Value-Based Healthcare Along the Continuum of Care: Real-Time Data, Measuring Outcomes and Reporting

### Workshop Responsible

Beatriz Ribeiro Barroso Dias Dias (Hocoma)

### Speakers

Beatriz Dias, Elena Siluyanova, Jose Lopez

### Attendee Engagement

We will do a discussion round to allow participants to share and discuss their challenges when providing rehabilitation along the continuum of care and what they think it's the best way to have a better overview of the patient progress. We will brainstorm on what are the key points to improve the reimbursement options and at the end vote to prioritize those key points/actions.

### Abstract

In this workshop, we will discuss the direction of value-based healthcare and how the MedTech industry is addressing this trend. By shifting to value-based healthcare, it becomes more important to have a better overview of the patient and track their progress along their treatment journey. It is imperative to collect more data and extract relevant information from the data to achieve that.

We will look at how this is reflected in the rehabilitation field, how we can go in the direction of creating an ecosystem in rehabilitation and we will showcase HocoNet, a Connected care solution for rehabilitation that supports the collection and integration, interpretation, and usage of more clinical data through the continuum of care.

A clinical expert will share a specific use case for the value of a complete patient report, from data collection, interdisciplinary team work to therapy adaptation and we will reflect on other valuable use cases like the choice of cost-effective treatments for our patients.

Moreover, we will have a discussion round with the participants on the challenges when providing rehabilitation along the continuum of care, how we can have a better overview of the patient's progress, and how we could use that for reimbursement options.
